About Longwell

The Ventilation and Drive Technology Partner for Mission-Critical Environments

OEM for Well-Known Brands | **Supplies Fortune 500 Companies** | **Global Technical Support**

LONGWELL is a leading fan manufacturer, specializing in high-quality fans, blowers, motors, and components for heating, ventilation, air conditioning, and refrigeration applications. We have a strong presence in delivery capabilities, design and R&D capabilities, as well as manufacturing, placing us at the forefront of the industry.

Our product range includes EC/DC/AC centrifugal fans, axial fans, AC/BLDC cross-flow fans, single/double forward curved fans, AC/BLDC/ECM motors, and industrial fan blowers. Since our establishment in 1990, we have continuously upgraded our facilities and production capacity, boasting advanced testing labs and production facilities with an annual capacity of millions of fans. With over 20 years of experience, we are highly skilled in the design, development, and manufacture of fans and motors. We export to over 30 countries and serve numerous Fortune 500 clients.

Our facilities and products are compliant with certifications such as ISO9001, ISO14001, BSCI, CE, UL/ETL, CCC, EMC, and LVD. These certifications demonstrate our compliance in quality management, environmental management, social responsibility, and product safety. We are quality-oriented and dedicated to providing products and services that meet international standards.

Equipped with advanced testing labs and production facilities, including a B&K noise lab, CFD simulation lab, air dynamics test chambers, automatic welding machines, CNC machining centers, and auto robot injection machines, we ensure efficient production and on-time delivery.

As industry leaders, we prioritize technological innovation and efficiency. We employ advanced technologies such as aerodynamics principles and CFD simulation to ensure precise and efficient fan designs. Additionally, we offer customized services to design and manufacture fan systems according to specific customer requirements. Our focus is on providing high-tech, high-efficiency products that meet our customers' needs and contribute to a better future.

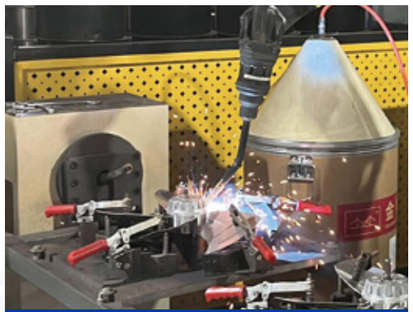

At LONGWELL, innovation is at the core of our operations, driving continuous improvement. With our extensive experience and expertise, we can quickly customize solutions that meet customer needs. We emphasize technological sophistication, utilizing advanced technologies and high-performance materials to deliver products that are efficient, safe, and reliable. Our brand is widely recognized globally, and we are committed to promoting sustainable development and advancing the efficient fan industry.

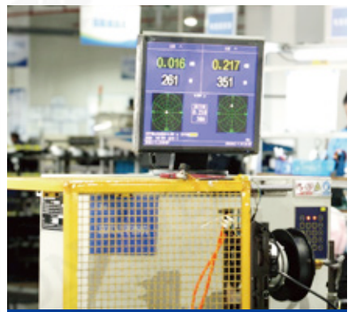

LONGWELL looks forward to collaborating with you and providing high-quality customized fan and motor solutions. Please feel free to contact us as we work together to create a brighter future.

The Working Principle of The LWSR Type Fan

The fan casing contains 2 sets of three-lobe impellers,driven by a pair of synchronous gears to perform reciprocating operation in opposite directions. The inlet port has a volume of V^1. Due to the rotation of the impellers, a low-pressur zone is formed, simultaneously drawing in air with a volume of V^2. As the resistance at the outlet increases, high-pressure gas is generated and then discharged. Since there is a certain clearan between the impellers and between the impellers and the casing, with no friction involved, the fan can operate continuously for extended periods. The following explains the key aspects of the spiral-shaped features of this fan.

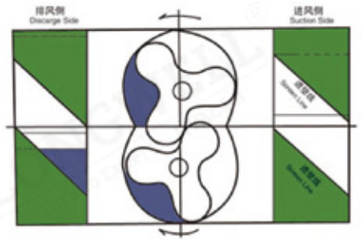

(1)

Rotor A: On the intake side, the entire width of the rotor is open and begins to progressively close. On the discharge side, it is progressively opening and has passed the halfway point of opening.

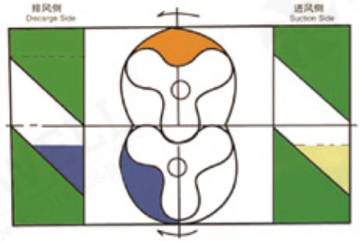

Rotor B: On the intake side, it is progressively closing and nearing full closure. On the discharge side, it is not yet open but is about to begin opening.

(2)

Rotor A: On the intake side, the entire rotor is now somewhat more closed than in position(1). The triangular holes indicated by the slanted lines are progressively shrinking along the casing cover line.On the discharge side, the exhaust process has been completed.

Rotor B:On the intake side, the rotor is about to reach the casing cover line. On the discharge side, during the exhaust process, the triangular holes are progressively opening.

(3)

Rotor A: Both the intake side and the discharge side are in a closed state, but the discharge side is about to begin opening.

Rotor B: The intake side has just started the closing process and is progressively closing, while the discharge side has progressively opened and is about to reach a fully open state.

LWSR Blower Specifications and Unit Conversion Table

- Each fan model is accompanied by performance charts and standard specifications, making it easy to select the appropriate model.
- The main fan unit, including accessories, is standardized and supported by a well-established mass production system, enabling us to meet your requirements promptly at any time.
- Thanks to its optimized spiral structure and the use of a silencer equipped with a matched silent air filter, the operating noise of the fan is significantly lower than before.
- The rotors are fully machined precision components, dynamically balanced during manufacturing to ensure minimal vibration.
- The compact design reduces the installation footprint.

LWSR Model Main Specifications

- Fan Port Diameter: 40-350mm
- Air Volume: 0.44-210m³/min
- Pressure: 9.8-150kPa
- Motor Power: /

Standard Accessories

- Ventilated base
- Belt guard
- Fan pulley, motor pulley, belt
- Silencer
- Safety valve
- Pressure gauge
- Anchor bolts
- Special accessories (provided as per contract requirements)
- Discharge silencer
- Gear oil
- Check valve
- Flexible connector

LWSR Model Performance Chart Description:

The performance chart illustrates the relationship between the fan model, port diameter, speed, discharge pressure, air volume, and required power.

The air volume shown in the performance chart is based on the standard intake conditions.

The standard conditions refer to a temperature of 20°C, an absolute pressure of 1.0332 kgf/cm² [101.3 kPa], and a relative humidity of 65%.

The air volume under reference conditions (temperature 0°C, absolute pressure 1.0332 kgf/cm² [101.3 kPa]) is generally expressed in Nm³/min. When the intake pressure remains the same, it can be converted to the air volume under standard conditions using the following formula.

$Q_S=Q_N\times1.0732$

Q_S=Air volume under standard conditions (m³/min)

Q_N=Air volume under reference conditions (m³/min)

The air volume under discharge conditions can be converted to that under standard conditions using the following formula.

$$Q_S=Q_d\frac{1.0332+Pd}{1.0332}\times\frac{273+ts}{273+td}$$

Qd: Discharge air volume (m³/min)

P_d: Discharge pressure (kgf/cm²)

t_s: Inlet air temperature (℃)

t_d: Discharge temperature (℃)

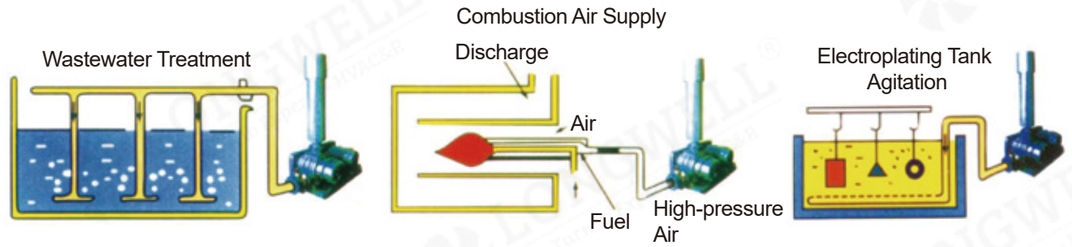

Based on the results obtained above, determine the required discharge pressure, and then refer to the performance chart to select the appropriate fan model, port diameter, rotational speed, and required power.

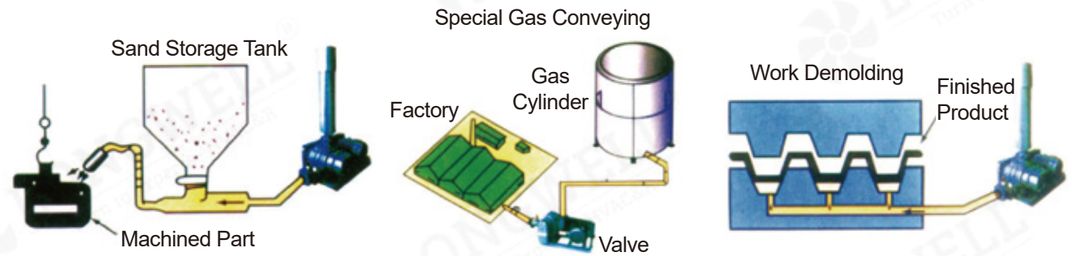

The performance chart uses different colors to indicate different motor output power ratings. Users should select a motor with the corresponding power rating.

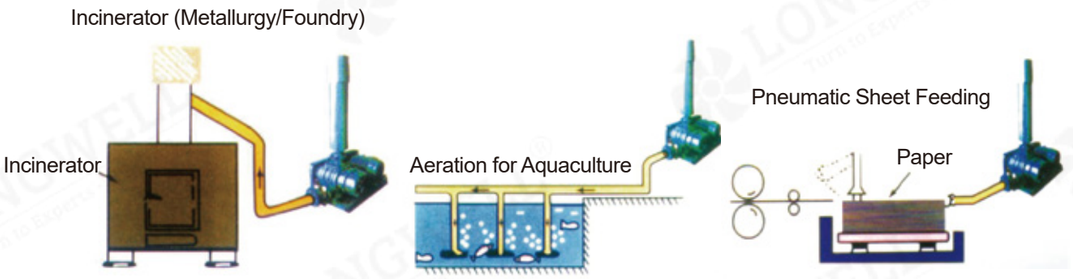

The selection ranges for some fan models may overlap. From an economic perspective, it is advisable to choose a smaller fan model; from a noise control perspective, a larger fan model is recommended.

	Pa	Bar	kgf/cm²	Atm	MnH_2O	MmHg(Torr)

LWSR Type Roots Blower Noise Level

Noise value DB(A)
Note: 1. The noise value is the average value measured 1.0m beside the fan with standard silencers fitted.
2. The noise value may vary depending on the length of additional pipework, the number of bends, and the surrounding environment.

Fault Cause and Solution

Fault Symptom	Cause	Remedy
High Noise	1. Pressure rise due to pipe blockage 2. Vibration due to improper belt guard installation 3. Motor bearing wear 4. Scoring/galling caused by dust ingress into the fan 5. Lack of lubricant 6. Poor lubrication 7. Loose pulley 8. V-belt slipping	1. Clean or replace the pipeline 2. Reinstall the belt guard properly 3. Replace the bearing with a new one 4. Overhaul the fan 5. Check the oil supply system 6. Clean the oil dropper and oil filter 7. Tighten the set screw 8. Adjust the belt tension
Overheating	1. Overload operation 2. Fan inlet filter blockage 3. Fan rotor misalignment/rubbing 4. Lack of lubricant 5. Belt slipping 6. Poor lubrication 7. Internal scoring/galling inside the fan	1. Check whether the pipeline is blocked 2. Clean the air filter 3. Gently tap the end cover with a wooden hammer 4. Refill the oil and check the oil supply system 5. Adjust the belt tension 6. Change the oil and clean the oil dropper and oil filter 7. Disassemble and inspect the fan
Insufficient Air Flow	1. Fan inlet filter blockage 2. Lack of lubricant 3. Poor lubrication 4. Belt slipping 5. Air leakage in pipeline 6. Pipeline too long	1. Clean the inlet filter 2. Check the oil supply system and refill oil 3. Clean the oil filter and oil dropper 4. Adjust the belt tension 5. Repair the pipeline 6. Reconfigure the pipeline
Excessive Oil Consumption	1. Overload operation 2. Air filter blockage 3. Oil leakage 4. Oil evaporation and splashing due to high temperature	1. Check the pipeline system 2. Clean the air filter 3. Repair the oil leakage point 4. Identify the cause and fix the problem
Damaged Belt	1. Overload operation 2. Belt slipping 3. Misalignment of the two pulleys	1. Adjustment 2. Adjustment 3. Adjustment
Motor Stops	1. Overload 2. Fan scoring/galling 3. Faulty power supply wiring 4. Excessive dirt inside the motor or bearing damage 5. Defective motor quality	1. Check the pipeline system 2. Overhaul the fan 3. Repair as needed 4. Clean the motor or replace the bearing 5. Replace the motor

Purchase Instructions

When purchasing a blower, please provide the following items as much as possible:

1. Application: sewage treatment, aquaculture, pneumatic conveying, etc.
2. Medium conveyed: air, etc.
3. Operating environment: indoor, outdoor, etc.
4. Operating conditions: flow rate, pressure, temperature, etc.
5. Motor: required or not

LWK Type Air Suspension Blower

Utilizing turbomachinery design technology, this product features a high-strength aluminum alloy three-dimensional flow impeller, paired with a high-speed permanent magnet synchronous motor and air foil bearings (or active magnetic bearings), achieving non-contact, friction-free operation without the need for lubrication. It requires no mechanical maintenance and offers high efficiency with low noise. The core components comply with international standards, ensuring high reliability to serve our customers.

Working Principle

Adopting air foil bearings, a high-speed permanent magnet synchronous motor, and direct-coupled drive with a three-dimensional flow impeller, the impeller generates kinetic energy during high-speed rotation. This kinetic energy draws air into the volute through the inlet, where it is converted into pressure potential energy within the volute passage, resulting in gas with a specific flow velocity and pressure. Finally, the gas is delivered into the pipeline network through the volute outlet, achieving the blower's function.

Ningbo Longwell Electric Technology Co., Ltd

Features of LWK Type Air Suspension BLower

Long service life: Friction-free, with a service life exceeding 20 years.

Compact size: Integrated design with high power density,
occupying only 1/3 to 1/5 of the volume of traditional blowers.
Simple installation—can be placed directly on the ground without the need for a foundation.

Easy maintenance: only requires cleaning the filter cotton as prompted by the system.

Energy saving: Utilizing an inverter-driven permanent magnet synchronous motor, an aviation-grade three-dimensional flow centrifugal impeller, and hydrodynamic air bearings, the operating status can be adjusted according to the load, achieving energy savings of 20%-50% compared to traditional blowers.

Cloud-based intelligent management: Users can manage via mobile devices or PC cloud platforms, with real-time transmission of operational data to facilitate timely analysis and service support.

Oil-free: Advanced hydrodynamic air bearings ensure friction-free operation, eliminating the need for oil lubrication.

Low noise: Low-noise centrifugal impeller design ensures no mechanical vibration, with noise levels below 80 dB.

The Main Structure of the LWK Type Air Suspension Blower

High-strength three-dimensional flow impeller

High-strength aluminum alloy centrifugal impeller, precision-machined by high-speed 5-axis CNC machining, offering strong deformability, wear resistance, corrosion resistance, high efficiency, and long service life.

High-efficiency permanent magnet synchronous motor

The motor features high power density and low heat loss, enabling operation in harsh and demanding environments. It offers high rotational speed, high efficiency, long service life, and moisture resistance.

High-strength three-dimensional flow impeller

100% oil-free foil bearings with no mechanical friction, offering semi-permanent service life. Features include non-contact operation, friction-free performance, no lubrication required, low noise, and long service life.

Variable frequency drive (VFD)

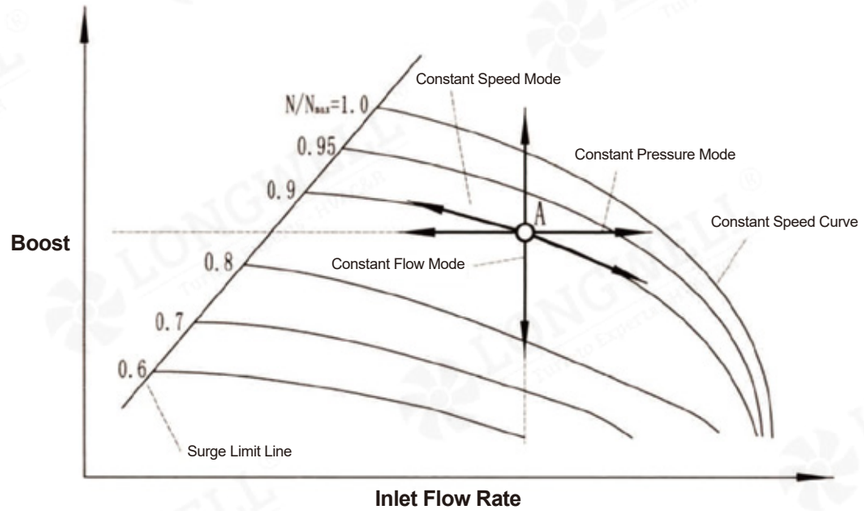

The VFD is used to control the frequency of the high-speed permanent magnet motor. It is equipped with a dedicated cooling device and a touch screen display, allowing on-site adjustment and monitoring of the equipment's operating status. The drive enables adaptive parameter configuration based on different working conditions, meeting customer requirements for automated control and unattended operation.

Data cloud platform

Interconnection of all things with data as the core. Based on the deep integration of Industrial Internet of Things (IIoT) technology and big data analytics, it provides rich algorithm models to offer customers full lifecycle information services for their equipment.

Note:
1. The flow rate in the above table refers to the inlet flow rate of a single fan under the conditions of 1 atm and 20°C.
2. For each model, the flow rate deviation at the rated pressure is within ±4%.
3. As site conditions may vary, please consult our professional technical personnel for specific model selection.

LWC Type Rotary Blower

Working Principle of the Rotary Blower

LWC Rotary Blower features a compact structure. Its pressure range is 0.1–0.5 kgf/cm².
It mainly consists of the following six parts: motor, air filter, blower body, air chamber, base (also serving as oil tank), and oil drip nozzle. The blower operates by the eccentric rotation of the rotor inside the cylinder, causing the volume between the blades in the rotor slots to change, thereby drawing in, compressing, and discharging air. During operation, the pressure difference generated by the blower automatically delivers lubricating oil to the oil drip nozzle, which drips into the cylinder to reduce friction and noise, while also preventing backflow of air inside the cylinder.

Characteristics of the Rotary Blower

Compact Size, High Airflow, Low Noise, and Energy Efficiency

(The rotary blower operates on the principle of compressing air through rotation. Despite its compact size, it delivers high airflow, saves energy, and operates quietly—features that are incomparable to other types of blowers.)

Stable Operation and Easy Installation

(When properly placed, small models operate with minimal vibration and do not require anti-vibration devices, making installation simple and convenient.)

Strong Load Resistance and Stable Airflow

(For example, even if pressure fluctuates in a sewage treatment aeration tank, the airflow remains largely unaffected by the pressure changes.)

High-Quality Materials, Ingenious Structure, and Excellent Performance

(All components are made from high-quality materials. The blower features a compact and durable design, ensuring excellent performance and long-term reliability with fewer failures.)

Built-in Air Chamber for Smooth Air Delivery

(All models are equipped with an air chamber to prevent air pulsation and ensure stable, smooth air distribution.)

Easy Maintenance, Low Speed, Reduced Wear, Fewer Failures, and Long Service Life

Wide Selection of Models and Speeds

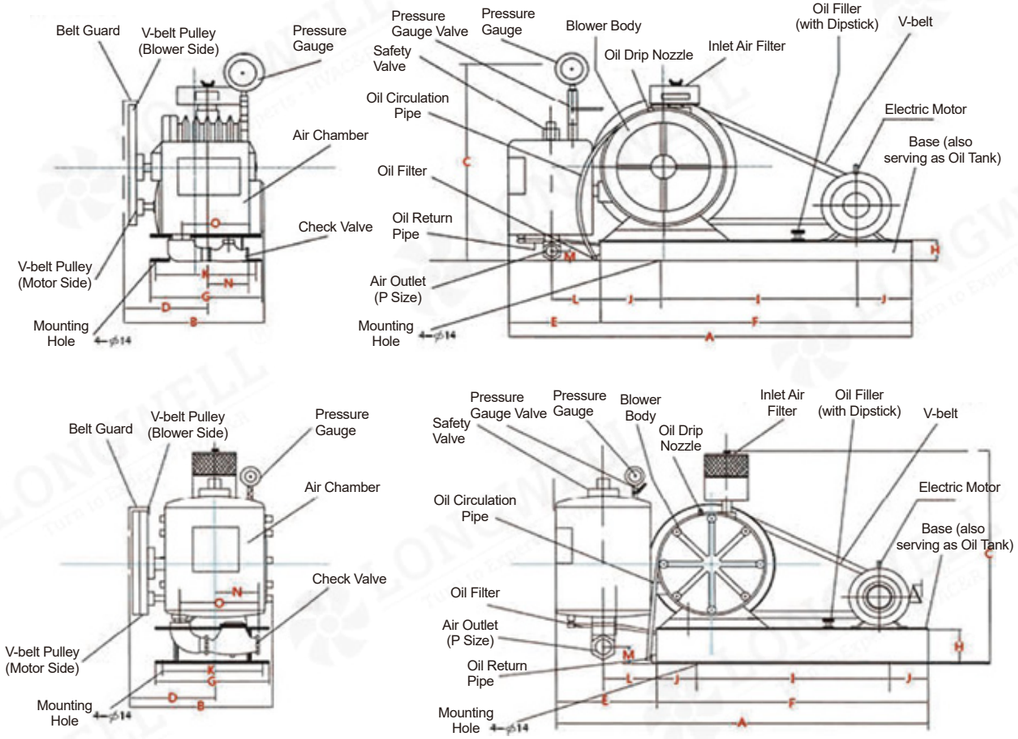

(A variety of models and rotational speeds are available to meet diverse needs. Customization is also available based on user requirements.)

Structure and Working Principle of the Rotary Blower

When the rotor, which is eccentrically installed inside the cylinder, rotates, it causes the four vanes (blades) inside the rotor slots to slide back and forth. This action draws in, compresses, and discharges air, enabling the blower to function. Friction occurs between the vanes, the rotor, and the cylinder wall, generating frictional heat.

Therefore, during operation, the oil drip nozzle injects the necessary lubricating oil into the cylinder. This lubricates the friction surfaces, reducing frictional heat and noise. It also forms an oil film between the components, maintaining the blower's internal seal.

The lubrication system is a circulating device that automatically supplies oil by utilizing the pressure difference generated during blower operation. Consequently, the blower must not be operated under no-load (idling) conditions!

Troubleshooting Guide for Rotary Blower

Fault Symptom	Cause	Remedy
High Noise	1. Pressure rise due to pipe blockage 2. Vibration due to improper belt guard installation 3. Motor bearing wear 4. Scoring/galling caused by dust ingress into the fan 5. Lack of lubricant 6. Poor lubrication 7. Loose pulley 8. V-belt slipping	1. Clean or replace the pipeline 2. Reinstall the belt guard properly 3. Replace the bearing with a new one 4. Overhaul the fan 5. Check the oil supply system 6. Clean the oil dropper and oil filter 7. Tighten the set screw 8. Adjust the belt tension
Overheating	1. Overload operation 2. Fan inlet filter blockage 3. Fan rotor misalignment/rubbing 4. Lack of lubricant 5. Belt slipping 6. Poor lubrication 7. Internal scoring/galling inside the fan	1. Check whether the pipeline is blocked 2. Clean the air filter 3. Gently tap the end cover with a wooden hammer 4. Refill the oil and check the oil supply system 5. Adjust the belt tension 6. Change the oil and clean the oil dropper and oil filter 7. Disassemble and inspect the fan
Insufficient Air Flow	1. Fan inlet filter blockage 2. Lack of lubricant 3. Poor lubrication 4. Belt slipping 5. Air leakage in pipeline 6. Pipeline too long	1. Clean the inlet filter 2. Check the oil supply system and refill oil 3. Clean the oil filter and oil dropper 4. Adjust the belt tension 5. Repair the pipeline 6. Reconfigure the pipeline
Excessive Oil Consumption	1. Overload operation 2. Air filter blockage 3. Oil leakage 4. Oil evaporation and splashing due to high temperature	1. Check the pipeline system 2. Clean the air filter 3. Repair the oil leakage point 4. Identify the cause and fix the problem
Damaged Belt	1. Overload operation 2. Belt slipping 3. Misalignment of the two pulleys	1. Adjustment 2. Adjustment 3. Adjustment
Motor Stops	1. Overload 2. Fan scoring/galling 3. Faulty power supply wiring 4. Excessive dirt inside the motor or bearing damage 5. Defective motor quality	1. Check the pipeline system 2. Overhaul the fan 3. Repair as needed 4. Clean the motor or replace the bearing 5. Replace the motor
